

## Lookup Of Ejbs

Example lookup-of-ejbs can be browsed at <https://github.com/apache/tomee/tree/master/examples/lookup-of-ejbs>

**Help us document this example! Click the blue pencil icon in the upper right to edit this page.**

## BlueBean

```
package org.superbiz.ejblookup;

import javax.ejb.EJB;
import javax.ejb.EJBException;
import javax.ejb.Stateless;
import javax.naming.InitialContext;
import javax.naming.NamingException;

//START SNIPPET: code
@Stateless
@EJB(beanInterface = Friend.class, beanName = "RedBean", name = "myFriend")
public class BlueBean implements Friend {

    public String sayHello() {
        return "Blue says, Hello!";
    }

    public String helloFromFriend() {
        try {
            Friend friend = (Friend) new InitialContext().lookup(
"java:comp/env/myFriend");
            return "My friend " + friend.sayHello();
        } catch (NamingException e) {
            throw new EJBException(e);
        }
    }
}
```

## Friend

```
package org.superbiz.ejblookup;

import javax.ejb.Local;

/**
 * This is an EJB 3 local business interface
 * A local business interface may be annotated with the @Local
 * annotation, but it's optional. A business interface which is
 * not annotated with @Local or @Remote is assumed to be Local
 * if the bean does not implement any other interfaces
 */
//START SNIPPET: code
@Local
public interface Friend {

    public String sayHello();

    public String helloFromFriend();
}
```

## RedBean

```

package org.superbiz.ejblookup;

import javax.ejb.EJB;
import javax.ejb.EJBException;
import javax.ejb.Stateless;
import javax.naming.InitialContext;
import javax.naming.NamingException;

//START SNIPPET: code
@Stateless
@EJB(beanInterface = Friend.class, beanName = "BlueBean", name = "myFriend")
public class RedBean implements Friend {

    public String sayHello() {
        return "Red says, Hello!";
    }

    public String helloFromFriend() {
        try {
            Friend friend = (Friend) new InitialContext().lookup(
"java:comp/env/myFriend");
            return "My friend " + friend.sayHello();
        } catch (NamingException e) {
            throw new EJBException(e);
        }
    }
}

```

## EjbDependencyTest

```

package org.superbiz.ejblookup;

import junit.framework.TestCase;

import javax.ejb.embeddable.EJBContainer;
import javax.naming.Context;

//START SNIPPET: code
public class EjbDependencyTest extends TestCase {

    private Context context;

    protected void setUp() throws Exception {
        context = EJBContainer.createEJBContainer().getContext();
    }

    public void testRed() throws Exception {

        Friend red = (Friend) context.lookup("java:global/lookup-of-ejbs/RedBean");

        assertNotNull(red);
        assertEquals("Red says, Hello!", red.sayHello());
        assertEquals("My friend Blue says, Hello!", red.helloFromFriend());
    }

    public void testBlue() throws Exception {

        Friend blue = (Friend) context.lookup("java:global/lookup-of-ejbs/BlueBean");

        assertNotNull(blue);
        assertEquals("Blue says, Hello!", blue.sayHello());
        assertEquals("My friend Red says, Hello!", blue.helloFromFriend());
    }
}

```
